

Name: \_\_\_\_\_

### Estimation Station

An estimate is a guess you make using what you know. Look at the jar of popcorn kernels. It contains one cup of popcorn kernels. Estimate how many kernels are in a cup.

My estimate is: \_\_\_\_\_

After you have made your estimate, count the actual number of kernels.

The actual number of kernels in the jar is: \_\_\_\_\_

Remember, good mathematicians don't change their estimates!

If I have two cups, about how many kernels will I have?

If I have three cups, about how many kernels will I have?

If I have ten cups, about how many kernels will I have?
